Adobe Photoshop is the industry standard for manipulating digital images. There are a few ways to modify a digital image in Photoshop. The first is by using filters, which are objects that alter a photo's look. Filters can be used to enhance a photo by tinting a photo, blur it out, change its color, make it grainy, and so on. Filters are also used to remove people and objects from an image. Another common editing method is by using the Appearance panel. In the Appearance panel, you can make objects more clear, add color or light, and in general, tweak your photo's look.

Method 1: Filters The Photoshop filters use a slider bar to control the effect they produce. Many Photoshop filters have preset settings for the amount of effect they have. With some, however, you can control the amount of effect you want by making the corresponding slider bar go up or down.

Method 2: Appearance The Appearance panel is similar to that of the filters; however, instead of using a slider bar, you control the effect using draggable tabs for different aspects of the photo.

Filters Filters are objects that manipulate an image, such as altering the color or brightness of an image. Filters can be used for a variety of tasks, such as enhancing, making a photo blurry, or even removing objects and people from a photo. They work with raster images and can make an image clearer, darker, and grainier.

Appearance The Appearance panel allows you to change a photo's lighting, color, and clarity, and increase, decrease, or change the angle of the image. You can move objects around, change the opacity of objects, change brightness levels, and use different colors. You can create special effects and make objects invisible. The key to editing an image is to learn how to manipulate layers and use them to make drastic changes to an image.

Creating Layers To edit an image, you need to create layers. Layers can be different colors, or the same color. A layer provides an opportunity to combine elements in an image. For example, you can choose the color red, then add black to it and then add white. As a result, the red is duplicated, but it also becomes black and white.

Using Layers Once a layer has been created, you can control how an image appears. You can edit colors,

Basic Photoshop tools When photographers, graphic designers, web designers or other users need to edit an image, they start

by opening the image in Photoshop. After a preview, they are able to manipulate the image. Some Photoshop tools are very important. Tool name Description Undo Undo (or Go back) is a basic tool used to undo the previous editing action.

Photoshop automatically saves an image without Undo. If you want to save an image with Undo, click on the menu bar “File” > “Save”. You have the choice between the following Undo options: Undo: This option will save the image with all the previous editing actions, including any additional Undo actions. Save as: This option will save the image without any Undo.

History: With this option, only the last 10 Undo actions will be displayed. Undo: This is an option that can be enabled/disabled for any of the options that save the image with Undo. Enhance

Enhance tool The enhance tool is used to manipulate the brightness, contrast and color. This tool can also be used for special effects such as color enhancement, image sharpening, and noise reduction. After selecting the “Enhance” tab, you can adjust the parameters of the tool. Contrast Brightness Shadows Highlights Color Saturation Hue Lighter color, darker color More Selective color changes based on a color range Remove color cast Polarize Adjust Sharpness Paste or paste as Paste into this image Paste into this layer Paste into the active document Add to selection Clone stamp Shape Create a new layer Add a clipping mask Shape Make a selection Convert to outline Save as Download the latest enhanced images as a high resolution image Adjust Levels Adjust gamma levels of an image Gamma Curves Adjust color curves Change black point, white point Change screen color or display color Change color, tint Adjust hue, saturation Threshold Filters Adjust sharpness Warp Warp and distort 05a79cecff

Q: dynamic query with php and mysql I'm new to php and mysql and I need some help with mysql. I'm working on a website where users upload photos and the photos are displayed on the website, very simple. I'm trying to make the backend as dynamic as possible, so users can have their own function to tag photos. I came up with the idea to implement an update function, that searches for the photo ID from the database and updates the array according to the user's changes. The problem is that I don't want to show the array, I just want it to update. Let's say that I have the following array of photo IDs (\$sids) in the database: 1,2,5,3,3,4 Now, I want to make a new array (\$newids) but with the IDs that the user has not tagged yet. So the \$newids should be: 1,5,3,3 I tried something like this: `$query = mysql_query("SELECT DISTINCT `photoId` from tableName"); while($row = mysql_fetch_assoc($query)) { $newids[] = $row['photoId']; }` But I get an error message, so I don't know how to update the query. I tried something like this but that doesn't work: `SELECT * FROM tableName WHERE id IN ("1,2,5,3,3,4");` EDIT: This code outputs the \$sids array in the html instead of updating the array. A: You need to build the query dynamically, that you can either do by running `SELECT * FROM tableName WHERE id IN ('1', '2', '5', '3', '3', '4');` or by implodeing them: `$newids = array(); while($row = mysql_fetch_assoc($query)){ $newids[] = $row['photoId']; } $sql = "SELECT * FROM tableName WHERE id IN (" . implode("','", $newids) . ")";` Microsoft releases Windows 10 for IoT – wireless and Surface - doener

Q: What is the difference between F# 'Subscription', F# 'Asynchronous Patterns', and WCF? I have read a lot on the internet, and have a lot of buzz words / concepts floating around in my head. The typical developer tries to help himself by summarizing things into the buzzword tags, but that is not helping me. Does anyone have some real (i.e. not buzzword) information as to what is the difference between the following: Web Controllers / Web API / WCF F# Asynchronous Patterns Service Oriented Architecture Service Consumer (Web Pages) F# Subscriptions ASP.NET MVC I feel like they are all just the same thing, but I have the feeling that I am missing something. I would really appreciate some practical information / links to some well written and referenced articles

that would really help me out, rather than just buzzwords, or a bunch of buzzwords thrown at me to "make it all just make sense".

A: What is WCF? WCF is an approach to host your services, it is a design pattern and also a framework.

F# Asynchronous Patterns They usually deal with cancellation, there are many libraries dealing with cancellation, like the one I like the most it is named F# cancellation. This library is used with F# lambdas. Also if you are not familiar with it, you can find more information about it here : [Cancellation of operations on Unix](#).

Service Oriented Architecture It is an architecture that help you define some abstracts for your services. Abstract services can become very useful to you later in your development. It helps you to create services so that you don't have to repeat yourself, and it is more abstract than the one of the WCF we talked about before. For information of this topic, I suggest you to read this article : [Design patterns in enterprise architecture](#)

F# Subscriptions This is an extension to F#. Basically, it is a way to know when a asynchronous operation you did in F# finishes. In F# code, you define a subscription like this : `subscription (fun (...) ->...)`. In C#, we would use the using keyword.
